Practical-7

PHP Form Processing with Server-Side Validation and CSV/JSON File Storage

Theory

1. Is the form submitted using POST?

Answer: yes,form submitting using POST Method.

2. Are inputs validated and sanitized server side?

Answer: Yes, inputs are validated and sanitized on the server side using PHP before storing them.

3. Is file writing handled safely?

Answer: Yes, file writing is handled safely using PHP, with validated data written to the file.

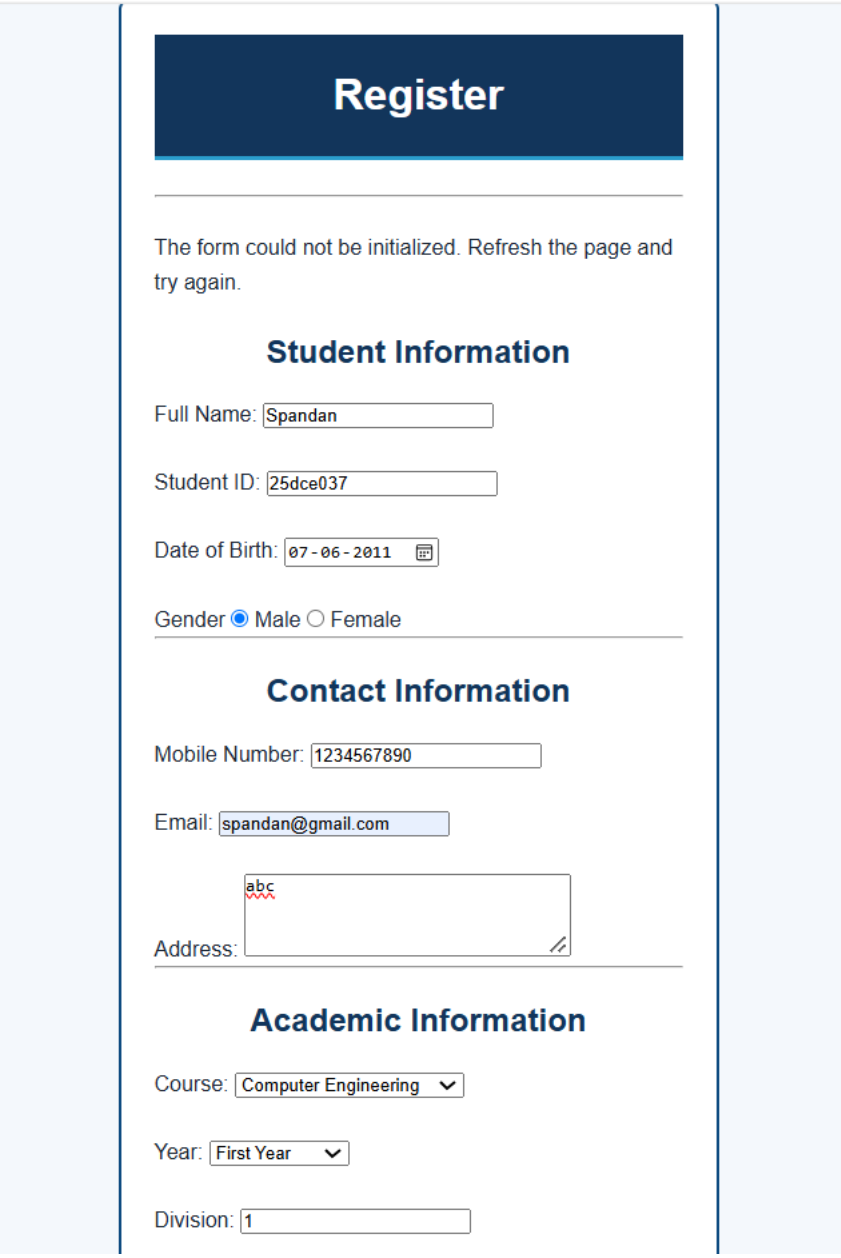

4. Are success and error responses displayed clearly?

Answer: Yes, success and error messages are displayed clearly to the user.

A. GitHub Repository Link:

https://github.com/25dce037-tech/Student-Hub-Portal.git

For XAMMP Server Link:-

http://localhost/Student%20Hub%20Portal/pages/Register.html

B. Challenges Faced:

- I did not know much about PHP at the beginning.
- I had difficulty understanding PHP syntax.
- I was confused about how to connect my HTML pages with PHP.
- I did not know how to run my project using the XAMPP server.
- I faced problems with placing my files correctly inside the htdocs folder.
- I found it difficult to store the form data in CSV/JSON files.
- I faced errors while connecting the HTML form with the PHP file.
- Updating my existing HTML and JavaScript pages to work with PHP was challenging.
- Understanding server-side validation and sanitization was also new for me..

C. Learning Outcome:-

I learned how to use PHP for server-side form processing, validate and sanitize form data, connect my HTML forms with PHP using XAMPP, and store submitted data in CSV/JSON files. I also understood how backend processing works with a website.
